WEEK PREVIEW

WEEK 3 · TERMINAL CORE

MODULE 01 · FILES, SUDO & PERMISSIONS

Build and destroy from the keyboard, edit files without a mouse, and crack the permissions grid.

MON AUG 3 + WED AUG 5 · 6:00–8:00 PM · ZOOM · LABS 01:02–06

This week is pure terminal. Monday we build `~/docker-course/`, edit files with **nano**, run your first **sudo** system update, install Docker's prerequisites — then the boss fight: **permissions**. Wednesday's clinic is mostly reserved for `chmod` / `chown` drills. Labs — not attendance — gate progress.

WEEK GOALS

1
BUILD & DESTROY
`mkdir`, `touch`, `cp`, `mv` — and your first careful `rm -r`. No undo exists.

2
READ & EDIT
`cat`, `less`, `tail -f`, **nano**. Exit keys memorized: **q**, **Ctrl+O**, **Ctrl+X**.

3
SUDO & INSTALL
`apt update` / `upgrade` clean, then install the Docker prerequisite packages.

4
PERMISSIONS
Read `-rwxr-x---` out loud and say who can do what. `chmod` + `chown` without guessing.

BEFORE MONDAY

- Module 00 gate screenshot must be **in D2L**
- Finish labs **01:00–01** (setup check + `pwd` / `ls` / `cd`)
- Confirm your remote still connects — green **WSL** or **SSH** badge
- Watch the Module 01 videos for 02–06 if posted in D2L
- Bring laptop + charger + your sudo/Linux password

KNOW BEFORE YOU TYPE

- `rm -r` has **no undo** — read the path twice, then read it again
- Password prompts type **invisibly** — keep typing, press Enter
- `less` and `top` aren't frozen — press **q** to quit
- nano saves with **Ctrl+O**, exits with **Ctrl+X**

MONDAY · INSTRUCTION

CLOCK	BLOCK	WHAT WE DO LIVE	LAB IDS
6:00	**Open + recap**	Sign-in · gate check · warm-up re-drill of `pwd` / `ls` / `cd`	—
6:10	**Making things**	Build `~/docker-course/` · `mkdir` / `touch` / `cp` / `mv` · slow-motion `rm -r` demo	01:02
6:35	**Inside files**	`cat` / `less` (press **q**!) · `tail -f` live-update demo · nano save + exit	01:03
7:00	**Sudo + installs**	`sudo whoami` · full `apt update` / `upgrade` · install Docker prereqs (break while it runs)	01:04–05
7:25	**Permissions**	The rwx grid on the board · `ls -l` · first `chmod` / `chown` drills · close + Wed preview	01:06

WEDNESDAY · LAB CLINIC

CLOCK	BLOCK	WHAT WE DO LIVE	LAB IDS
6:00	**Lab triage**	`rm -r` fear · nano/less exit keys · `tail -f` "frozen" confusion · apt lock errors	01:02–05
6:40	**Permissions clinic**	The week's sticking point — `chmod` / `chown` drills until the rwx grid reads like English	01:06
7:30	**Stretch**	All five labs done? Peek at networking (`ping`, `curl`) — next week's opener	01:07
7:50	**Close**	Confirm 01:02–06 submitted · homework through Sunday · Week 4 phase-gate warning	—

Core path this week: labs **01:02 → 03 → 04 → 05 → 06**, in order — each one builds on the last. Warm rows = stretch. Budget your patience for **01:06 permissions**; it's the concept the Module 01 phase-gate (next week) leans on hardest.

2	5	~65m	rwx
LIVE BLOCKS	CORE LABS	TYPING TIME	BOSS FIGHT

LAB LAYOUT — WHAT "DONE" LOOKS LIKE

Each row is one D2L learning object. Do the video (if available), then the lab, then submit the screenshot. Do them **in order** — lab 02 creates the directory every later lab uses.

CORE MODULE 01 · TERMINAL CORE

Mon focus · Wed cleanup

#	LAB	WHAT YOU DO	PASS / SCREENSHOT
01:02	Making Things	MON Create `~/docker-course/` and its subfolders with `mkdir` · make files with `touch` · `cp` / `mv` drills · delete a throwaway dir with `rm -r` (read the path twice).	`ls ~/docker-course/` lists the expected subfolders
01:03	Looking Inside Files	MON Write a notes file with `echo` · read with `cat` / `less` · watch it live with `tail -f` (second terminal!) · edit in **nano**.	Save with **Ctrl+O**, exit with **Ctrl+X**, quit `less` with **q** — no panic
01:04	Sudo & Updates	MON Confirm `sudo whoami` says **root** · run a full `sudo apt update` + `sudo apt upgrade -y` (downloads take a few minutes — that's normal).	Upgrade finishes cleanly; system reports nothing left to upgrade
01:05	Installing Software	MON Install the Docker prerequisite packages (`ca-certificates`, `gnupg`, and friends). Type every command even if it says "already installed" — muscle memory counts.	Every package reports installed with no errors
01:06	Permissions Drills	MON WED Read `ls -l` listings · change modes with `chmod` · change owners with `sudo chown` · learn the owner / group / everyone triplets.	Read `-rwxr-x---` out loud and say exactly who can do what

STUCK-SPOT CHEAT SHEET

MOMENT	WHAT FAILS	FIX LINE
rm -r	Scared to run it / wrong path	No undo exists. Read the path you typed, then read it again — then run it
less / top	"My terminal is frozen"	It's a pager, not a freeze — press **q** to quit
nano	Can't save or get out	**Ctrl+O** then Enter to save · **Ctrl+X** to exit — arrows won't escape
tail -f	Looks stuck doing nothing	It's waiting for new lines. Open a second terminal and `echo` into the file — watch it appear
apt	"Could not get lock / dpkg lock"	Another apt process is running — wait it out; don't kill it unless truly stuck
chown	"Operation not permitted"	You forgot `sudo`. Everyone does it once — that's the lesson
chmod	Tempted to type `777`	Never on a real server — it means anyone can do anything. Set only what's needed

After Wednesday → Sunday: labs **01:02–06** submitted in D2L. Minimum comfort: you can build and delete directories without fear, exit nano and `less` without Googling, and read an `rwx` listing out loud. **Next week:** networking, processes, pipes — then the timed, no-help **Module 01 phase-gate**.
